CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic linkages in oligosaccharides and polysaccharides.

COFACTOR: BINDS A CALCIUM ION REQUIRED FOR ITS ACTIVITY.

DEVELOPMENTAL STAGE: PRODUCTION OF ALPHA-AMYLASE IS HORMONALLY REGULATED. GERMINATING EMBRYOS PRODUCE THE HORMONE GIBBERELLIC ACID, WHICH WITHIN 10 HOURS STIMULATES THE ALEURONE CELLS COVERING THE ENDOSPERM OF THE SEED TO PRODUCE ALPHA-AMYLASE. THE ENZYME

COEACTOR: BINDS A CALCIUM ION REQUIRED FOR ITS ACTIVITY.

DEVELOPMENTAL STAGE: PRODUCTION OF ALPHA-AMYLASE IS HORMONALLY

REGULATED. GERMINATING EMBRYOS PRODUCE THE HORMONE GIBBERELLIC

ACID, WHICH WITHIN 10 HOURS STIMULATES THE ALEURONE CELLS COVERING

THE ENDOSPERM OF THE SEED TO PRODUCE ALPHA-AMYLASE. THE ENZYME

THEN DEGRADES THE STARCH WITHIN THE ENDOSPERM FOR USE BY THE

DEVELOPING PLANT EMBRYO.

MISCELLANDOUS: THERE ARE AT LEAST 4 TYPES OF ALPHA-AMYLASE IN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     European

pinitted (AIG-1998) to the EMBL/GenBank/DDBJ databases.
FUNCTION: ORPHAN RECEPTOR. INTERACTION WITH RXR SHIFTS RXR FROM
ITS ROLE AS A SILENT DNA-BINDING PARTNER TO AN ACTIVE LIGAND-
BINDING SUBUNIT IN MEDIATING RETINOID RESPONSES THROUGH TARGET
GENES DEFINED BY LIXES. LIXES ARE DR4-TYPE RESPONSE ELEMENTS
CHARACTERIZED BY DIRECT REPEATS OF TWO SIMILAR HEXANUCLOTIDE HALF-
SITES SPACED BY FOUR NUCLEOTIDES. LRXA PLAYS AN IMPORTANT ROLE IN
THE REGULATION OF CHOLESTEROL HOMEOSTASIS.
SUBCELLULAR LOCATION: Nuclear (Potential).
SUBCELLULAR LOCATION: Nuclear (Potential).
SIMILARITY: Belongs to the nuclear hormone receptor family. NR1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      subfamily.

-ITISSUE SPECIFICITY: VISCERAL ORGANS SPECIFIC EXPRESSION. STRONG
EXPRESSION WAS FOUND IN LIVER, KIDNEY AND INTESTINE FOLLOWED BY
SPLEEN AND TO A LESSER EXTENT THE ADRENALS.
-I- INDUCTION: BY 9-CIS RETINOIC ACID (9CRA).
-I- SINULTARITY: Belongs to the nuclear hormone receptor family. NR1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 +++

EMBO J. 15:5701-5714(1996).
-i- FUNCTION: INVOLVED IN THE BIOGENESIS OF RRNA.
-i- FORMATION OF 18S AND 5.8S RRNA.
-i- SUBCELIULAR LOCATION: Nuclear; nucleolar.
-i- SIMILARITY: Contains 4 HAT repeats.
-i- SIMILARITY: Contains 11 S1 motif domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Connor R., Dedman K., Devlin K., Gentles S., Hamlin N., Hunt S., Jagels K., Lye G., Moule S., Odell C., Pearson D., Rajandream M.                                                                                                                                                                              FUNCTION: THE FUNCTION OF THE SECOND TRP OPERON IN S.COELICOLOR TO PRODUCE TRP FOR THE BIOSYNTHESIS OF CALCIUM-DEPENDENT ANTIBLOTIC (CDA).

CATALYTIC ACTIVITY: 1-(2-carboxyphenylamino)-1-deoxy-D-ribulose phosphate = 1 (indol-3-yl)91/cerol 3-phosphate + CO(2) + H(2)0.

PATHMAX: Tryptophan biosynthesis; fourth step.

SIMILARITY: BELONGS TO THE TRPC FAMILY.

ENAYME REGULATION: INHIBITED BY AMP, WHICH AFFECTS THE TURNOVER
BOUND SUBSTRATE AND NOT THE AFFINITY FOR SUBSTRATE.

PATHWAY: NECESSARY FOR, AND SPECIFIC TO, GLUCONEOGENESIS.

SUBUNIT: HOMOTETRAMER. WITH FOUR BINDING SITES
BACH FOR THE SUBSTRATE, FOR AMP, AND FOR DIVALENT METAL CATION

(THE GREATEST AFFINITY IS FOR INC).

MISCELLANEOUS: THE MOLECULE HAS A HIGHLY REACTIVE CYSTEINE RES:

(CYS-116 OR CYS-128), WHICH TENDS TO FORM MIXED DISCUFIDES (E.C.)

WITH HOMOCYSTINE) BUT IS NOT ESSENTIAL FOR ENZYME ACTIVITY.

Rittenhouse J., Chatterjee T., Marcus F., Reardon I., Heinrikson I Rittenhouse J., Chatterjee T., Marcus F., Reardon I., Heinrikson I Ranno acid sequence of the COOH-terminal region of fructose-1,6-bisphosphatases in relation to cyclic AMP-dependent phosphorylation.

J. Biol. Chem. 258:7648-7652(1983).

-I- CATALYTIC ACTIVITY: D-fructose 1,6-bisphosphate + H(2)0 = D-fructose 6-phosphate + phosphate.

-I- ENZYME REGULATION: INHIBITED BY AMP, WHICH AFFECTS THE TURNOV.
                                                                                                                                                                                                                                                                                                                          MEDLINE-8904(197; PubMed-2847161; MEDLINE-8904(197; PubMed-2847161; El-Maghrabi M.R., Pilkis J., Marker A.J., Colosia A.D., Fraser B.A., Pilkis S.J.; "cDNA sequence of rat liver fructose-1,6-bisphosphatase for down-regulation of its mRNA by insulin."; Proc.
